

Beginner Execution Guide

How to receive, verify, execute, and manage Vixale trading signals without exposing the proprietary strategy logic.

THE SIMPLE WORKFLOW

Vixale separates signal delivery, monitoring, and execution. Think of the process as three connected tools:

01 TELEGRAM Receive time-sensitive alerts and follow-up instructions.	02 VIXALE SITE Verify the signal and monitor status, portfolio, and updates.	03 BROKER Manually place and manage the orders described by the signal.
---	--	---

What this guide covers

This guide explains the user-facing execution workflow for Prime / Edge day trades, Swing portfolio trades, and Options straddles. It does not disclose the proprietary rules used to generate the opportunities.

Important: Examples below are hypothetical and are not live signals. P&L; examples exclude commissions, fees, slippage, taxes, and assignment/exercise effects.

Day Trading - Signal to Broker

Prime and Edge use the same beginner workflow: receive the alert, verify the details on Vixale, execute the order in your broker, then manage the published target and Stop Ref.

1

Get the signal

Watch Telegram and the Vixale site for a Prime or Edge signal.

2

Read every field

Confirm side (BUY/SELL), symbol, size, entry, target, and Stop Ref before acting.

3

Execute in your broker

Place the entry order described by the signal. Do not substitute a different symbol, direction, or size.

4

Place the profit target

After the entry fills, place the published profit-taking limit order for the filled quantity.

5

Monitor Stop Ref

Treat Stop Ref as the published monitoring/reference level. If the signal instructs an exit after a qualifying close below/above that level, follow that instruction in your broker.

6

Keep monitoring Vixale / Telegram

Follow later status or management instructions until the trade is closed.

ILLUSTRATIVE EXAMPLE

BUY 100 AAPL @ \$300.00 | TGT \$302.00 | STOP REF \$299.00

+\$200

Target result

$(\$302 - \$300) \times 100$

-\$100

Example exit at Stop Ref

$(\$299 - \$300) \times 100$

Beginner interpretation: buy 100 AAPL at the instructed entry, place a limit order to sell 100 shares at \$302 after the fill, and monitor the published Stop Ref at \$299. The exact stop/close condition is whatever the live signal specifies; do not infer a timeframe from this example.

Key distinction: a Stop Ref is an instruction-monitoring reference. Do not automatically convert it into a broker stop order unless the live instructions explicitly tell you to do so.

Active Portfolio - Daily Check

Swing trades are managed from the Vixale Active Portfolio. The beginner task is simple: check the portfolio during the daily update window, act on new additions, and close positions that later disappear from the active list.

- 1 Check the update window**
 Every trading day, review the Swing Active Portfolio between 9:45 and 10:00 AM.
- 2 Look for a new addition**
 If a stock is newly added to the Active Portfolio, treat it as a new actionable portfolio position.
- 3 Enter at the current price**
 Open the position in your broker at the current market price available when you act.
- 4 Set the risk parameters**
 From your actual fill price, calculate a +10% profit target and a -5% stop/risk level.
- 5 Check again on following days**
 Keep reviewing the Active Portfolio during the update window.
- 6 If the stock drops off the portfolio**
 Close the position at market as soon as practical. A portfolio removal overrides waiting for the original +10% target.

ILLUSTRATIVE EXAMPLE

MSFT NEW ADDITION TO ACTIVE PORTFOLIO FILL \$420.00 20 SHARES		
\$462.00 +10% target Potential P&L,: +\$840	\$399.00 -5% stop/risk Potential P&L,: -\$420	+\$140 Removed, exit \$427 (\$427 - \$420) x 20

Calculations use the actual \$420 fill: $420 \times 1.10 = \$462$ target; $420 \times 0.95 = \$399$ stop/risk level. If MSFT is removed from the Active Portfolio before either level is reached, exit at market rather than waiting for the original target.

Why “new addition”: the user-facing instruction describes what changed in the Active Portfolio without revealing the proprietary selection logic behind the portfolio.

Straddles - Evening Signal Workflow

For Options straddles, the user follows the published structure and management messages. The strategy rules that decide when or why a straddle is selected remain proprietary.

- 1 Watch the signal window**
 Monitor Telegram and the Vixale Options section between 18:00 and 20:30 for a new straddle signal.
- 2 Read the complete structure**
 Use the exact underlying, expiration, strike, call/put legs, and contract quantity stated by the signal.
- 3 Open the straddle in your broker**
 Execute the call and put structure as instructed. Confirm your combined filled premium.
- 4 Place a +10% profit target**
 Calculate the profit limit from the combined premium actually paid for the straddle.
- 5 Monitor Telegram + Options**
 Continue watching both channels for subsequent hedge, adjustment, or exit instructions.
- 6 Follow management instructions**
 If a hedge or exit instruction arrives, follow it rather than trying to reverse-engineer the proprietary strategy rules.

ILLUSTRATIVE EXAMPLE

SPY | 1x1 STRADDLE | CALL \$4.20 + PUT \$3.80 = \$8.00 COMBINED PREMIUM

\$800 Initial debit \$8.00 x 100	\$8.80 +10% target Value \$880 / P&L; +\$80	\$7.40 Example managed exit Value \$740 / P&L; -\$60
--	---	--

Illustration assumes one standard U.S. equity option contract per leg with a 100x multiplier. The actual signal supplies the strike, expiration, and size. Fees and execution differences are excluded.

One-page Checklist

System	When / Where	Entry	Management
Prime / Edge	Telegram + Vixale signal	Use published side, size, entry	Published target + Stop Ref + updates
Swing	Active Portfolio, 9:45-10:00 AM	New addition at current price	+10% target / -5% stop-risk; exit if removed
Options Straddles	Telegram + Options, 18:00-20:30	Exact published structure	+10% combined-premium target; follow hedge/exit updates

Before every order

- Verify symbol, direction, quantity/contracts, entry, and target before submitting the order.
- Use your actual fill price when the instructions call for percentage-based targets or risk levels.
- Keep Telegram and the relevant Vixale section open for status, hedge, and exit updates.
- Do not invent missing strategy rules. If the live instruction changes the plan, follow the live instruction.
- Treat all examples in this guide as illustrations, never as current trade recommendations.

Execution principle

Vixale tells you what action is published for the system. The proprietary engine decides why the opportunity exists. The user only needs the actionable instruction, its current status, and the correct broker execution.

This material is an operational guide to reading Vixale system instructions. It is not a guarantee of execution price, profitability, or future results. Trading and options involve risk, including the risk of loss.
